## PSOOP (JAVA)

-Lecture 4 Compiled by Nikahat Mulla

### AGENDA

- Complex class-> Objects as parameter example
- Array of Objects example

### COMPLEX CLASS

• Consider a class called Complex which provides operations to add, subtract, multiply 2 complex numbers. Design and Implement the Complex class in Java.

#### ARRAYS IN JAVA: EXAMPLE

A Café provides a small list of items in the menu as under:

- 1. Cheese Burger
- 2. Chocolate Cake
- 3. Cold Coffee
- 4. Cappuccino
- 5. Cheese Pizza

Consider an Order placed at the Café

The order consists of a list of items along with the quantity and price of each item.

Create a class called Order with data: order\_id, item[],item\_price[],item\_qty[]

Write a method called calculateTotal() which computes total for a given order. Create an array of orders in main() and call the calculateBill() method for all orders.

Later, call a method called analyseOrders(Order[], int total) which finds which orders fetch more than the given total.

# THANK YOU
